

I find HID headlights to be blinding. This is especially noticeable in rural areas with no other lighting to soften the glare. I literally cannot see when I meet HID headlights on a dark night on a narrow, winding rural road. Trying to look at the right shoulder really does not help much. My age of 50+ probably adds to the problem, but there are a lot of us 50+ folks out here driving. Please try to come up with some type of headlight specifications that allow for increased forward vision for the driver without blinding oncoming drivers. We need both pieces to make our roads safer at night.

Thank you!
